

Using the Health Record eXchange: Initial Health Summary Upload

The **Initial Health Summary Upload** (HIS) is generated from the practice clinical database and is a **once off event**. Unlike the normal GP event summary, it provides an opportunity to include historical data in the seeding patient record.

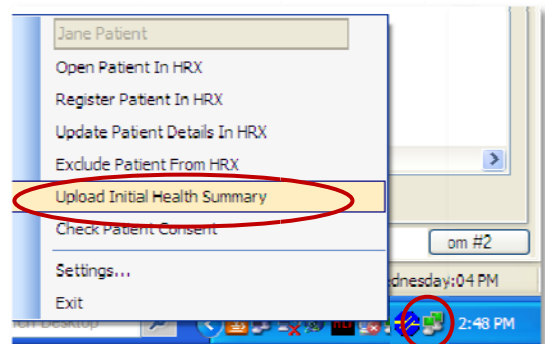

Note... to confirm that your computer is online, check that two green screens appear on the MDUploader icon in your system tray (the system tray is usually located on the bottom right corner of your screen).

1. Once you receive notification that the patient has been consented to the Health Record eXchange (HRX), open the patient's chart in Medical Director. After all the usual MD windows, right click on the **MDUploader** icon and click on **Upload Initial Health Summary**.

First, right click on the MDUploader.

Second, left click on *Upload Initial Health Summary*

2. Next, you need to select all the Allergies, Diagnoses¹, Medications, etc that you wish to upload. Once you are finished, select **Upload** to send the information onto the shared record.

Select events you wish to upload.

Select **Upload** when finished.
