

GoToMyPC®

Remote access with GoToMyPC®

GoToMyPC® software enables you to access your surgery computer information from any standard Internet connection.

GPpartners has used Citrix **GoToMyPC®** software since early 2008 to connect GPs to their surgery clinical systems.

Initially implemented to support GPs working in residential aged care facilities, this solution has many other applications where GPs need to access their data.

It is simple to use and provides an encrypted connection across the Internet ensuring patient information remains private and secure.

Our initial findings showed improvements in communication and patient care when GPs used **GoToMyPC®** to access their surgery clinical information from remote locations.

Benefits of **GoToMyPC®** include:

- reduced amount of paper work and double handling
- ease the burden of script writing
- allow easy access to past medical history
- provide access to decision support tools
- improve access to information technology including electronic referrals

GoToMyPC® software works with most Internet connections including wireless broadband laptop connections. Installation requires an email address. The software is low cost, easy to use and should not require additional IM/IT support.

'I have just been remotely connected to my practice work computer from Tarry Brae RACF. What a great advance this is. It may change my mind about ceasing visiting RACFs. Well done. Hope it spreads across all RACFs asap.'

Dr Ann McBryde, Chapel Hill
